The nucleic acids comprising the SNPs and probes and primers for detecting them may be used in assays for the diagnosis of diseases associated with SNPs (such as sickle cell anaemia, agammaglobulinaemia, diabetes insipidus, Lesch-Nyhan syndrome, muscular dystrophy, Miskott-Aldrich syndrome, Fabry's disease, familial hypercholaemia, polycystic kidney disease, hereditary spherocytosis, von Willebrand's disease, tuberous sclerosis, hereditary haemorrhagic telangiectasia, familial colonic polyposis, Bhlers-Danlos syndrome, osteogenesis imperfecta, and acute intermittent porphyria, symbtoms of, or susceptibility to, multifactorial diseases of which a
                construct stably integrates into the genome by homologous recombination, and implanting the cell into a host organism, where a whole animal develops from the implanted cell. The present sequence is a PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; single nucleotide polymorphism; SNP; sickle cell anaemia; agammaglobulinaemia; diabetes insipidus; Lesch-Nyhan syndrome; muscular dystrophy; Miskott-Aldrich syndrome; Fabry's disease; familial hypercholesterclaemia; polycystic kidney disease; cancer; hereditary spherocytosis; von Willebrand's disease; tuberous sclerosis; hereditary haemorrhagic telangiectasia; familial colonic polyposis; Ehlers-Danlos syndrome; osteogenesis imperfecta autoimmune disease; acute intermittent porphyria; inflammation; nervous system disorder; infection; rheumatoid arthritis; multiple sclerosis; diabetes; systemic lupus erythematosus; Graves disease; longevity; obesity;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Aminopeptidase P; XPNEP2; bradykinin receptor B1; ds; BDKRB1; tachykinin receptor B1; TACR1; C1 esterase inhibitor; C1NH; kallikrein 1; K1K1; bradykinin receptor B2; BDKRB2; gene therapy; angiotensin converting enzyme 2; ACR2; protease inhibitor 4; P14; polymorphism, haemandjoma; tumour; sarcoma; Crohn's disease; trachoma; cardiovascular disease; angina pectoris; hypertension; heart failure; myocardial infarction; ventricular hypertrophy; vascular disease; angioedaema; arteriosclerosis; aberosclerosis; coronary artery disease; angioedaema; autoimmune disease; inflammatory arthritis; cancer; wound; viral infection; bacterial infection; tungal infection; COPD; chronic obstructive pulmonary disease; enterocolitis.
                                                                                                                                                                                                                            The present invention relates to the isolation of novel human PRO polypeptides (AAU86128-AAU86162) and the polynucleotide sequences encoding them. The PRO polypeptides, agonists, antagonists or anti-PRO antibodies are useful for treating benign or malignant tumours (e.g. renal, kidney, bladder, breast, etc), leuksemias and lymphoid malignancies, other disorders such as neuronal, glial, astrocytal, hypothalamic, glandular, macrophagal, stromal and blastocoelic disorders, inflammatory, immune and angiogenic disorders. The polynucleotide sequences are also useful in gene therapy. The present sequence represents a PCR primer used in the methods of the present invention
                                                                                                                     Thirty five nucleic acids encoding PRO polypeptides, useful for treating benign or malignant tumors, leukemias and lymphoid malignancies, inflammatory, angiogenic and immunologic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

Perrone MH; Ma-Edmonds M, Zerba KE, Tsuchihashi Z, Hui L, Swanson BN, Powell JR;

WPI; 2002-619265/66.

New isolated nucleic acid with at least one polymorphic position, useful for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and autoimmune diseases.

Disclosure; Page 706; 977pp; English.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (RDKB1), cleaterase inhibitor (CIMH), kallikrein cachytinin receptor B2 (BDKB2), angiotensin converting enzyme 1 (KLKI), bradykinin receptor B2 (BDKB2), angiotensin converting enzyme 2 (ACE2) or protease inhibitor 4 (P14), comprising at least one composition Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nuclectide polymorphisms comprising additional 5 and 3' flanking genomic compaining the sample from one or more individuals and determining the nucleic acid sequence, (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more polymorphic positions in a gene cochaining the sample from one or more polymorphic positions in a gene computed of a protein selected from the group above; (3) constructing (M2) chaplotypes using the genes comprising grouping at least two nucleic acids; (4) identifying (M3) an individual at risk of developing a disorder cusing the polymorphic data; (5) a library of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) and composition with a known data set. The genes, (M1, M2, M3 and M4) condicated present in at least one polymorphic position, and compositions are useful for detecting, diagnosing treating, various disorders such as angioedeame and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's cherenting various disorders such as angioedeame and diseases with hypertension, heart failure, myocacular diseases like angina pectoris, chypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary contrivitive various gangia and/or atherisming anterior and composition with an enries and composition, heart failure, myocacular diseases inflammance. polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The and biological samples. The present sequence is included in the sequence listing but is not referred to anywhere else in the specification

autoimmune diseases.

The invention relates to an isolated nucleic acid from a human gene encoding aminopeptidase P (KPNBP2), bradykinin receptor B1 (RDKRB1), cachykinin receptor B2 (RAKR), cleaterase inhibitor (CINMI), kallikrein (KIKII), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 1 (ACE2) or protease inhibitor 4 (PI4), comprising at least one composition. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic comprising (MI) at least one nucleic acid sample comprising obtaining the sample from one or more individuals and determining the nucleic acid sequence at one or more polymorphic positions in a gene comprising grouping at least two nucleic acids encoding a protein selected from the group above; (3) constructing (M2) haplotypes using the genes comprising grouping at least two nucleic acids encoding a protein of an ACE inhibitor and/or vasopetidase inhibitor using the polymorphic data; (5) a library of nucleic acids, eacto of which comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the culdividual comprising obtaining a nucleic acid sample, determining the culdivalual composition with a known data set. The genes, (M1, M2, M3 and M4) and composition with a known data set. The genes, (M1, M2, M3 and M4) confocial proverenting various disorders such as angiodeemes and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, crohn's disease, trachomas, and cardiovascular diseases and composition, heart failure, myocardial infarction, ventricular cornary contary anterposis, and disease, anterprosis, and contains and hypersensitivity reactions, sepsis, autoimmune diseases, inflammatory arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (COPD) and enterocolitis (many other diseases and disorders are listed in the specification). The polynucleotides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines

cuccining the sample in the or more polymorphic obstitions in a gene encoding a protein selected from the group above; (3) constructing (M2) and individual at least two nucleic acids; (4) identifying (M3) an individual at least two nucleic acids; (4) identifying (M3) an individual at least two nucleic acids; (8) allorary of nucleic acids, each of which comprises one or more polymorphic positions within a gene encoding a human protein selected from the group above; and (6) genotyping (M4) an individual comprising obtaining a nucleic acid sample, determining the nucleotide present in at least one polymorphic position, and comparing at least one position with a known data set. The genes, (M1, M2, M3 and M4) and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, diagnosing, treating, and compositions are useful for detecting, the agine pectoris, involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's converting various disorders such as angioedame and diseases which involve angiogenesis like haemangiomas, tumours, sarcomas, Crohn's disease, trachomas, and cardiovascular diseases like angina pectoris, hypertrophy, vascular diseases, aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis aneurysm, embolism, thrombosis, coronary artery disease, arteriosclerosis and/or atherosclerosis, and arthritis, cancer, wounds, viral, bacterial or fungal infection, Chronic obstructive pulmonary disease (CoPD) and entercoolitis (many other diseases and disorders are listed in the specification). The polymuclocides are also useful for chromosome identification. Antibodies against the proteins may be utilised for immunophenotyping of cell lines and biological samples. The present sequence is included in the sequence is included in the sequence of listing but is not referred to anywhere else in the specification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       encoding aminopeptidase P (XPNEP2), bradykinin receptor B1 (BDKRB1), tachykinin receptor B1 (TACR1), C1 esterase inhibitor (CINH), kallikrein 1 (KLK1), bradykinin receptor B2 (BDKRB2), angiotensin converting enzyme 2 (ACE2) or procease inhibitor 4 (P14), comprising at least one polymorphic position. Also included are (1) a probe that hybridises to a polymorphic position as provided in the detailed summary of single nucleotide polymorphisms comprising additional 5' and 3' flanking genomic sequence; (2) analysing (M1) at least one nucleic acid sample comprising obtaining the sample from one or more individuals and determining the
                                                                                                                                                                                                                                                                                                    New isolated nucleic acid with at least one polymorphic position, us for detecting, diagnosing and treating disorders such as angioedema, cancer, viral, bacterial or fungal infection, cardiovascular and

The invention comprises a mutant form of the human aquaporin 5 (AQP5) gene. Aquaporin (AQP) is a family of water channel proteins, through which water is transported into and out of cells - ten types of mammalian AQP have been identified so far. The invention also comprises an oligonucleotide (OGN) chip having 902 oligonucleotide primer sequences and a cDNA chip comprising one or more sequences from the human AQP5 gene. The mutant AQP5 gene is useful for diagnosing cancer (i.e lung cancer). The OGN chip is useful for detecting mutations and polymorphisms in AQP5 and the cDNA chip is useful for analysis of gene expression. The present DNA sequence represents a human aquaporin (AQP) gene PCR primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel aquaporin 5 gene mutant useful for diagnosing lung, stomach, colon, prostate, or head or neck cancer.

The invention comprises a mutant form of the human aquaporin 5 (AQP5) gene. Aquaporin (AQP) is a family of water channel proteins, through which water is transported into and out of cells - ten types of mammalian AQP have been identified so far. The invention also comprises an oligonuclectide (OGN) chip having 902 oligonuclectide primer sequences and a cDNA chip comprising one or more sequences from the human AQP5 gene. The mutant AQP5 gene is useful for diagnosing cancer (i.e lung cancer). The OGN chip is useful for detecting mutations and polymorphisms in AQP5 and the cDNA chip is useful for analysis of gene expression. The present DNA sequence represents a human aquaporin (AQP) gene PCR primer
Novel aquaporin 5 gene mutant useful for diagnosing lung, stomach, colon, prostate, or head or neck cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates, (b) a primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. to array the multiwell discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the resultant cultures are amplified by using the above primer; (g) signals
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; chromosome 1p36-35; chromosome 21q22.1; genetic analysis; genome;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                   The invention comprises a mutant form of the human aguaporin 5 (AQP5) gene. Aguaporin (AQP) is a family of water channel proteins, through which water is transported into and out of cells - ten types of mammalian AQP have been identified so far. The invention also comprises an oligonucleotide priner sequences and a cDNA chip comprising one or more sequences from the human AQP5 agene. The mutant AQP5 gene is useful for diagnosing cancer (i.e lung cancer). The OGN chip is useful for detecting mutations and polymorphisms in AQP5 and the cDNA chip is useful for analysis of gene expression. The present DNA sequence represents a human aquaporin (AQP) gene PCR primer
                                                                                                                                                                                                                                                                                              Novel aquaporin 5 gene mutant useful for diagnosing lung, stomach, colon, prostate, or head or neck cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human; ss; PCR; primer; aquaporin; AQP5; AQP; water channel protein; oligonucleotide chip; OGN chip; cDNA chip; lung cancer; mutation detection; polymorphism detection; gene expression.

The present invention describes a ribozyme comprising Hu MT-Ia Rz, Hu MT-IC Rz, Rz1-2, or Rz4-9

(see ABM88812 to ABM88819. The ribozymes have cytostatic activity. The ribozymes are targeted to metallothionein (MT) and so are metallothionein concercibles in human cancer cells, for inhibiting tumour growth, and for chancing the effectiveness of chemotherapy or radiation therapy against cancer cells. The ribozyme-based methods for treating cancer, from the present invention, offer the following advantages over conventional artisense-based methods of limiting metallothionein production in target cells: (1) ribozymes destroy metallothionein-encoding mRNAs rather than core be recycled to degrade multiple mRNA molecules; (3) a ribozyme need con have perfect complementarity with a target mRNA to destroy the RNA; can be recycled to degrade multiple mRNA molecules; (3) a ribozyme need con have perfect complementarity with a target mRNA to destroy the RNA; can did (4) a single ribozyme can be designed to deetroy several related conventional antisense molecule can be designed to be effective against conventional antisense molecule can be designed to be effective against various mRNAs. ABN88819 to ABN88870 represent sequences used in the
                                                                                                                                                                                                                                                                      .

Isolated nucleic acid molecules having polymorphisms in known human genes e.g. cytochrome p450 and cathepsin S useful as genetic linkage markers for locating, identifying and characterizing the genes responsible for disorder-related traits.

Example 10; Page 119; 714pp; English.

This invention relates to the sequence of an isolated nucleic acid
molecule comprising at least one base variation from that of a known
cut chuman cytochrome P450 Al (CYP4501A1), cytochrome P450 A2 (CYP4501A2),
cytochrome P450 Al (CYP4501A1), adrenergic receptor betal (ADBR1),
cytochrome P450 OZE1 (CYP4500ZE1), adrenergic receptor betal (ADBR1),
cytochrome P450 OZE1 (CYP4500ZE1), adrenergic receptor bidacepam binding
cytochrome P450 OZE1 (CYP4501A2), cytochrome P450 DEAL
(ARA), parly hydrocarbon receptor nuclear translocator
(ARA), property (CYSS), cytochromede 2 (GYC12), histamine-N-methyl
transferase (HNWT), NADPH quinone oxidoreductase 2 (NOO2),
transferase (HNWT), NADPH quinone oxidoreductase 2 (NOO2)
transferase (HNWT), nantheran 2) KLK2, nicothianine—N-methyl
transferase (HNWT), nantheran 2) KLK2, nicothianine—N-methyl
transferase (HNWT), nothiane receptor (URD2B7), UDP-glucuronosyl transferase 287 (UGT2B7), UDP-glucuronosyl transferase 287 (UGT2B7), UDP-glucuronosyl
transferase (UGT2B15), urokinase receptor (URD2B7), untilityl
creeptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2) CHMR3 CHMR5) sequence
contains in the human genes cited in the invention are useful
genetic linkage markers for locating and characterising the genes that
creeptor 1, 2, 3, 4, or 5 (CHMR1, CHMR2) CHMR3 be used in disponsible for specific traits within the genome and eventually
identifying the genes responsible for a variety of disorder-related
traits as a result of their e.g., overexpression, which may be used in disponsible
contains and/or tracting the disorders. The nucleic acid molecules contained in CYP4501A1, CYP4501A2,
ARNY, BPHX2, GST12, NNMT, NQO2, NR112, STM, UGT2B4, UGT2B4, UGT2B1, ARNY, MR1 and/or MDR3 are useful to metabolism: The polymorphic sequences contai susceptibility to colorectal timours, in DBI or CHMRI for altered central nervous system function, in FLAP and HNWT for altered pulmonary, immunological to haematological function, in KLK2 for altered serine procease activity in the prostate, in LTF for altered immunological or haematological function, in CHMR3, CHMR4 or CHMR5 for altered central and peripheral nervous system function. The present sequence represents a polymorphic DNA sequence of the invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      30-DEC-2001
                                              ABK16377;
       The invention relates to a nucleic acid encoding a adipose (ADP)

polypeptide which regulates, causes or contributes to obesity in an animal or a human. The polymucleotides, proteins, ant-adp antibodies, modulators of adp activity, adp antisense nucleic acids, expression vectors, adp transgenic animals are useful in the diagnosis and treatment of obesity, adiposites, bulimia, wasting (acabaxia), eating disorders and/or disorders of body weight/body mass, weight loss due to cancer or infectious diseases, genetic disorders associated with hypogonadism e.g. rader wills syndrome, haurence-Moon-Biedl syndrome, hypothyroidism, diseases, inflammatory bowel disease, ulcerative colitis, and anorexia diseases, inflammatory bowel disease, ulcerative colitis, and anorexia corvosa. They are also useful for treating disorders of body weight/mass e.g. glycogen storage diseases, and lipid storage diseases and for treating lipomas, and/or liposarcomas. The compositions are also useful to treating negative content of the process of the treating heart disease, hypertension, and infertility and for treating content of the process of the treating heart disease, hypertension, and infertility and for treating content of the present of the 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     treating conditions associated with under weight e.g. enhancing or controlling fertility, controlling weight loss in acquired immunodeficiency syndrome (AIDS) or cancer patients. The present sequence is a PCR primer used to amplify an adp nucleic acid
                                                                                                         adipositas; bulimia; wasting; cachexia; eating disorder; body weight disorder; weight loss; cancer; infectious disease; hypogonadism; Prader-Willi syndrome; Laurence-Moon-Biedl syndrome; hypothyroidism; diabetes; Cushing's syndrome; endocrine disorder; gastrointestinal diseases; inflammatory bowel disease; PCR primer; ulcerative colitis; anorexia nervosa; glycogen storage disease; lipid storage disease; lipoma; liposarcoma; heart disease; hypertension; infertility; acquired immunodeficiency syndrome; AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel nucleic acid encoding adipose polypeptide which regulates, causes or contributes to obesity, useful for treating obesity, heart disease, hypertension, infertility, and controlling weight loss in cancer
                                                                                         Adipose protein; ss; adp; obesity; transgenic animal; obesity;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                0.8%; Score 14.2; DB 1; Length 21;

The invention relates to a nucleic acid encoding a adipose (ADP)

Combined which regulates, causes or contributes to obesity in an animal or a human. The polymouleotides, proteins, ant-adp antibodies, modulators of adp activity, adp antisense nucleic acids, expression vectors, adp transgenic animals are useful in the diagnosis and treatment of observed in the diagnosis and treatment of of obesity, adiposites, bulimia, wasting (cachexia), eating disorders and/or disorders of body weight/body mass, weight loss due to cancer or infectious diseases, genetic disorders associated with hypogonadism e.g. Prader Willi syndrome, Laurence-Moon-Biedl syndrome, hypothyroidism, diabetes, Cushing's syndrome, endocrine disorders, gastrointessinal chisabetes, Cushing's syndrome, endocrine disorders, and anorexia nervosa. They are also useful for treating disorders of body weight/mass corporating they are also useful for treating disorders of body weight/mass corporated with under weight e.g. enhancing or treating lipomas, and/or liposarcomas. The compositions are also useful corporations associated with under weight e.g. enhancing or controlling fertility, controlling weight loss in acquired immunodeficiency syndrome (AIDS) or cancer patients. The present sequence is a PCR primer used to amplify an adp nucleic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
or contributes to obesity, useful for treating obesity, heart disease, hypertension, infertility, and controlling weight loss in cancer

This invention describes a novel method of predicting the risk, and/or diagnosis, of carcinoma and inflammatory bowel disease (IBD) associated with a genetic predisposition. The method comprises testing a subject's DNA for the presence of a polymorphic UGTLA7 allele (UGT = uridine diphosphate-5'-glucuronosyl transferase) that contains mutations in codons II, 129, 131 and/or 208. Polymorphic UGTLA7*2, UGTLA7*3 or carbolic characterisation of antitumour therapeutics and for examining textbolic characterisation of antitumour therapeutics and for examining texticity/carcinogenicity of potential UGTLA7 substrates. The products of the invention have cytostatic and antiinflammatory activity and are appropriate for gene therapy. The method of the invention is used for diagnosis, or assessing risk, of carcinoma, especially of the colon, indentification of subjects at risk. This sequence represents a primer used in the identification of the UGTLA7 polymorphism at codon II of the

The invention relates to promoting blood flow within the vasculature of a mammal, comprises administering to the mammal an amount of a mammal, comprises administering to the mammal an amount of a pharmaceutical formulation that comprises an adipocyte complement related protein; zsig37, having residues 26-281 of a sequence appearing as Composition, zsig37, having residues 26-281 of a sequence appearing as ABG99070. Also included is a method of pacifying damaged collagenous tissues within a mammal, comprising administering to the mammal an amount complication of the damaged collagenous tissues by inhibiting complement activation or by reducing thrombosis formulation. The method is useful in promoting blood flow within the vasculature of a mammal by reducing thrombogenic and complement activity, and in pacifying damaged collagenous surfaces (e.g. in trauma, ischaemia, reperfusion, intestinal stramman sursopaam; stroke, percutaneous transluminal angioplasty, constructory accidental vascular trauma or surgical infarction, cardiopulmonary bypass ischaemia, myocardial infarction, cantabody are useful as inhibitors of hasemostaasis and immune function, in complating wound healing, and for antimicrobial applications. The buman complement used to sequence cDNA encoding mouse zsig37
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Promoting blood flow within the vasculature of a mammal, comprises administering a pharmaceutical formulation comprising zsig37 proteins.

The invention relates to an antisense oligonucleotide complementary to a region of the open reading frame of human folate receptor alpha comprising a 774-bp sequence. Also included are inhibiting growth of cancer cells susceptible to growth inhibition, a ribozyme containing the antisense oligonucleotide and a vector comprising the antisense oligonucleotide. The antisense oligonucleotide is useful for preparing a composition for treating cancer of the ovary, cervix, uterus and brain. The present sequence is an antisense oligonucleotide targeting the human

The invention decsribes a new polypeptide (ZTRYPI) having a sequence comprising amino acid residues 44 (Val) - 276 (Ile), 24 (Leu) - 276 (Ile), 24 (Leu) - 276 (Ile), 04 (Mal) - 314 (Leu), 07 1 (Mer) - 314 (Leu), 07 1 (Mer) - 312 (Leu), 07 3 (Mal) - 275 (Mag), 19 (Marg) - 275 (Mag), 43 (Val) - 312 (Leu), 19 (Marg) - 312 (Leu) of a 312-amino acid Homo saptens sequence (hsp) or CC a 233 fusion polypeptide sequence. The ZTRYPI polypeptide is useful cor treating a dysfunction associated with contractile tissues), and may be used for suppressing or enhancing contractility in vivo. In particular, the ZTRYPI polypeptide is useful cortracting actions in heart), inflammatory cardiovascular disease (e.g. inflammatory actions in heart), inflammatory control in view dysfunction. The polypeptide is also useful in birth control, in vitro fertilisation, or inducing birth. This sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            chromosome 17q25.2; vascular occlusion; vasodilation;
                                                                                                                                                                                                                     New tryptase-like polypeptides (ZTRYPI), useful for treating a dysfunction associated with contractile tissues (e.g. heart), for modulating contractility, or for treating e.g. cardiovascular disease,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

gene, e.g., cancer or immune disorders.
                                                                                                                Minimizing vascular occlusion or inducing vasodilation within the vasculature of a mammal, by administering an adipocyte complement related protein, zsig37 that promotes blood flow.
                                                                                                                                                                                  The invention relates to a method for minimising vascular occlusion or inducing vasculation within a mammal; involving administering of formulation comprising an adipocyte complement related protein, zsig37. The method is useful for minimising vascular occlusion and inducing vasculation in a mammal suffering from acute vascular injury which may be due to vascular reconstruction, tranma, stroke or aneurysm. The vascular injury is due to plaque rupture, degradation of the vasculature,
                                                                                                                                                                                                                                                                                                                                                                         Gaps

The invention describes a new isolated polynucleotide encoding a serine protease polypeptide comprising a sequence of amino acid residues that is 90% identical to a sequence comprising; amino acid residues 44-276, 24-276, 44-314, 24-314 or 1-314 or maino acid sequence or amino acid sequence or amino acid sequence, or 233 amino acids. 19-312 or 1-312 of the 312-amino acid sequence, or 233 amino acids. The polynucleotide is useful in diagnosing diseases associated with the ztrypl gene, e.g., cancer or immune disorders. Ztrypl proteins are useful for treating inflammatory, reproductive (e.g. infertility and contraceptive), testicular and heart disorders. They are also useful for treating asthma and arthritis. This sequence represents a primer used in the isolation and analysis of mouse
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of promoting blood flow within the vasculature of a mammal. The method involves administering an adipocyte complement related protein (Acrp) to the mammal to reduce and complement activity within the vasculature. Methods and compositions of the invention are useful in promoting blood flow within the vasculature of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Adipocyte complement related protein, collagenous surface pacification, wound healing; tumour metastasis, gene therapy; thrombogenic, mouse;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a predictor set comprising a plurality of polynucleotides or polypeptides whose expression pattern is predictive of the response of cells to treatment with a compound that modulates protein tyrosine kinase activity or members of the protein tyrosine kinase pathway. Also described: (1) predicting whether a compound is capable of modulating the activity of cells, comprising obtaining a sample of cells, determining whether the cells express a plurality of markers, and correlating the expression of the markers to the compound's ability to modulate the activity of the cells; (2) a plurality of cell lines for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention comprises oligonucleotides for detecting and identifying subtypes of human papilloma virus (HPV) contained in a sample. The oligonucleotides of the invention are useful for simultaneously detecting and identifying subtypes of HPVs. The present DNA sequence represents an oligonucleotide that was used in the exemplification of the invention.
polypeptides have cytostatic activities, and can be used in gene therapy. The polynucleotides and polypeptides are useful in predicting the activity of compounds that interact with protein tyrosine kinases and/or protein tyrosine kinase pathways. These may be used in determining drug genetic profiles which aid in treating diseases and disorders (e.g. cancer) based on patient response at a molecular level. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

The methods and compositions of the present invention are useful for diagnosing and treating damaged collagenous tissues, such as cardiopulmonary bypass ischaemia and resuscitation, myocardial infarction or post-trauma vasospasm including stroke, percutaneous transluminal angioplasty, endarterectomy, accidental vascular trauma or surgical induced vascular trauma. They can also be used in reducing thrombosis formation within the vasculature of a mammal. The present sequence is
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    promoting blood flow within the vasculature of mammals using an adipocyte complement related protein, useful for diagnosing and treating cardiopulmonary bypass ischemia, myocardial infarction, stroke and/or vascular trauma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              cytostatic; gene therapy, PRO; PRO197; PRO207; PRO226; PRO232; PRO243; PRO256; PRO269; PRO274; PRO304; PRO339; PRO1558; PRO779; PRO1185; PRO1265; PRO5775; PRO5775; PRO5773; PRO5725; PRO202; PRO206; PRO364; PRO313; PRO542; PRO713; PRO661; PRO116; PRO156; PRO366; PRO360; PRO360; PRO360; PRO360; PRO360; PRO360; PRO580;

Promoting blood flow or inducing vasodilation within vasculature of mammal, or pacifying damaged collagenous tissues or pacifying surface of prostatic biomaterial, by administering adipocyte complement related protein.

Example 9; Page 29; 46pp; English.

vaccular injury, where the injury is due to vascular reconstruction which comprises angioplasty, coronary artery bypass graft, endarterectomy, comprises angioplasty, coronary artery bypass graft, endarterectomy, an excovascular repair or anastomosis of a vascular graft, or the injury is due to trauma, stroke or aneurysm. The method is useful for pacifying damaged collagemous tissues within a mammal, where the damaged collagemous tissues within a mammal, where the damaged collagemous tissues are due to injury associated with ischaemia intestinal collagemous tissues are due to injury associated with ischaemia intestinal repertusion. The injury associated with pre- and post-establishment of strangulation, or injury associated with pre- and post-establishment of creasitation, mycardial infarction, or post-trauma vasospasm. The post- creasitation, mycardial infarction, or post-trauma vasospasm. The post- creama vasospasm comprises stroke, percutancous transluminal angioplasty, endarterectomy accidental vascular trauma or surgical-induced vascular trauma vasospasm comprises stroke, percutancous transluminal angioplasty, endarterectomy accidental vascular trauma or surgical-induced vascular trauma vasospasm comprises stroke, percutancous transluminal angioplasty.

Crequit, fibrin or fibronectin. The method is useful for mediating wound repression in wound healing comprises reduction in the creation in the method is useful for inhibiting platelet creduction in infection. The method is useful for inhibiting platelet creduction in infection. The method is useful for inhibiting platelet creatment. The method is useful for inhibiting platelet creatment. The method is useful for inhibiting platelet creatment. The method is useful for inducing vasculating comparating comparating comparating mammal. The method is useful for mediating mediating mycoardium from reperfusion injury. The method is useful for mediating vasodilation within the vasculature of a mammal, pacifying damaged collagenous tissues or surface of prostatic biomaterial, mediathing wound repair, inhibiting platelet adhesion, activation or accretion, minimising vascular occlusion, protecting ischaemic myocardium from reperfusion protecting ischaemic myocardium from reperfusion complishing tuminour metastrasis, comprising administering adipocyte complement related protein. The method is useful for promoting blood flow within the vasculature of a mammal where the mammal suffers from acute invention relates to a method of promoting blood flow or inducing

The invention relates to an isolated antibody that binds to a PRO polypeptide. The methods and compositions of the present invention are useful for diagnosting, prognosticating and/or treating neoplastic tumours, such as lung, colon, breast, prostate, rectal, cervical and liver tumours. The PRO polypeptides are also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of Human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. The present sequence is used in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated antibodies binding PRO polypeptides, useful for diagnosing, prognosticating and/or treating neoplastic tumors, such as lung, colon, breast, prostate, rectal, cervical and liver tumors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 21 BP; 6 A; 5 C; 8 G; 2 T; 0 U; 0 Other;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     g
                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a novel isolated polypeptide, designated NoVX.

The novel polypeptide comprises a sequence comprising 109-1671 amino acids to the mature form; a sequence that is at least 954 identical to compensative substitutions in the 109-1671 amino acid polypeptide; or a sequence comprising one or more composition; a method for determining the presence or amount of the composition; a method for determining the presence or amount of the polypeptide or nucleic acid molecule in a sample, determining the composition; a method for determining the presence or amount of the polypeptide or nucleic acid molecule in a sample, determining the composition; a method for of expression of the polypeptide in a first mammalian subject; identification to, a disease associated with the altered levels of nucleic acid or of expression of the polypeptide in a first mammalian subject; identification of an agent that binds to the polypeptide; dentification of a potential therapeutic agent for treating a pathology related to aberrant expression or physiological interactions of the polypeptide; a method for modulating the activity of the polypeptide; a method for modulating the activity of the polypeptide; treating a pathological state in a mammal; an isolated nucleic acid molecule; a coll comprising the nucleic acid have cytostatic acid and a method for producing the polypeptide. The NoVX polypeptide can be used in create a vaccine. The polypeptide is composition for treating or preventing a composition for treating or preventing a composition for treating or preventing a composition for preventing or preventing a composition for treating or preventing a composition for treating or preventing a composition of care a vaccine. The polypeptide is nathology as mannal and a method for predate a vaccine. The polypeptide is not the polypeptide in a mammal and a method for predate a vaccine. The polypeptide is not the polypeptide and a method for predate a vaccine. The polypeptide is a composition for treating or predated in a man
                                                                                                                                                                                                                                                                                           or

                                                                                                                                                                                                                                                                                                                                                                                                                  Novel polynucleotide useful for PCR amplification along with two DNA fragment from another set of sequences, or for detecting single
 gene and is useful for detecting a single nucleotide polymorphism inman gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           .

Use of adipocyte complement related protein for promoting blood flow within the vasculature, pacifying damaged collagenous tissues, pacifying the surface of a prostatic biomaterial or mediating a wound repair within
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to polynucleotides and polypeptide molecules for use asinhibitors in haemostasis and immune function. The invention is useful promoting blood flow, pacifying damaged collagenous tissues, pacifying the surface of a prostatic biomaterial and mediating a wound repair within a mammal. The invention is also useful in preventing infection at the wound site. The present sequence is a primer used to to generate mouse zsig37 DNA. The primer is used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  nucleic acid amplification; primer; PCR; detection; chromosome aberration; lymphoproliferative disorder; ss.

The present invention describes a set of nucleic amplification primers capable of amplifying a VH-JH or DH-JH IGH, VK-JK or VK/intron-Kde IGK, Valambda-llambda IGL, Vbeta-Jbeta TCRB or Dbeta-Deta TCRB, VY-JY TCRG, Vdelta-Jdelta, Ddelta-Ddelta or Vdelta-Ddelta TCRB rearrangement comprises a forward primer and a reverse primer. Also described: (1) a nucleic acid amplification assay, preferably a PCR or multiplex PCR or wiltiplex PCR or viriatron-Kde IGK, Vlambda-Jlambda IGL, Vbeta-Jbeta TCRB or Dbeta-CTC or VK/intron-Kde IGK, Vlambda-Jlambda IGL, Vbeta-Jbeta TCRB or Dbeta-CTC or VK/intron-Kde IGK, Vlambda-Jlambda IGL, Vbeta-Ddelta or Vdelta-Ddelta CTCRD rearrangement; (3) detecting chromosomal translocation (11;14) (BCLG-CTCB) carrangement; (3) detecting chromosomal translocation (11;14) (BCLG-CTCB) carrangement; (5) assessing clonal rearrangements and/or chromosome aberrations; and (6) a xit for the detecting at least one rearrangement comprising the set of primers. The new set of nucleic amplification primers capable of amplifying a VH-JH or DH-JH IGH, VK-JK or VK/intron-CTCRC, Vdelta-Jdelta-Ddelta Ddelta-Ddelta TCRB, vary TCRG, Vdelta-Jdelta-Ddelta or Vdelta-Ddelta TCRB, rearrangement are useful in diagnosing lymphoproliferative disorders. The present correcting a very invention.
                                                                                                                                                                                                                                                       New set of nucleic amplification primers comprising a forward primer a reverse primer and capable of amplifying a rearrangement, useful in diagnosing lymphoproliferative disorders.
                                                                                                Van Dongen JJM, Langerak AW, Schuuring EMD, San Miguel Garzia Sanz R, Parreira A, Smith JL, Lavender FL, Morg

Ribozymes having modified bases and methods for producing them - for use in inhibiting disease related genes.

Claim 2; Page 228; 407pp; English.

The present sequence represents a preferred target sequence for an enzymatic nucleic acid (i.e. a ribozyme) which cleaves relA mRNA at the nuclectide base position indicated in the DE line. The relA gene product is a subunit of the transcriptional regulator NF-kappaB and is implicated specifically in the induction of inflammatory responses. Regions of the mRNA that do not form secondary folding structures and that contain protential hammerhead and hairpin ribozyme cleavage sites were identified by computer analysis. Ribozymes directed against these mRNA sequences were designed and synthesised with modifications that improve their nuclease reastance. The ribozymes are designed to cleave the target sequences and thereby inhibit relA expression, making them potentially useful for treating rheumatoid arthritis, restenosis and asthma as well as for increasing tolerance to transplanted tissues. The potential immunosuppressive properties of a ribozyme cleaves relA mRNA means that uses are limited to local delivery, acute indications or ex vivo treatment. (Updated on 25-MAR-2003 to correct PI field.)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        21-JUN-1999;
                                                                                             30-MAR-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          28-DEC-2000.
                                               AAF50616;
skin disorders. The method comprises contacting the skin with an antisense oligonucleotide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBB3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonucleotides of the present invention (see AAFA5151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborrhoea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hoperneovascular condition such as neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood vessels or any other hyperplasia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Ameliorating the effects of a disorder, e.g. psoriasis, by administering UV (ultra-violet) treatment (optional) and an antisense nucleic acid that inhibits or reduces growth factor mediated cell proliferation and/or

                                              The present invention relates to a method for ameliorating the effects of skin disorders. The method comprises contacting the skin with an antisense oligonuclectide, (for Insulin-like Growth Factor [IGF]-1 receptor, IGF binding protein [IGFB]-2 or IGFBP3), which is capable of inhibiting or reducing growth factor mediated cell proliferation, inflammation and/or other disorders. The present sequence is an oligonuclectide which can be used to design the antisense.
                                                                                                                                                                                                                                         oligomuclectides of the present invention (see AAF45151 and AAF45153-F45161). The method is useful for ameliorating the effects of psoriasis, ichthyosis, pityriasis, ruba, pilaris, serborkhea, keloids, keratosis, neoplasias, scleroderma, warts, benign growths, cancers of the skin, a hyperneovascular condition such as a neovascular condition of the retina, brain or skin, growth factor-mediated malignancies, other sclerotic disease, kidney disease, hyperproliferation of the inside of blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ..

50.7% homology to the human EphA7 expressed and its gene is located on chromosome 1. Ephrin receptors are overexpressed in various cancers and it has been found that inhibition of NEPHA expression promotes apoptosis. The invention also relates to the NEPHA transcriptional control (promoter) region (ADM76037); recombinant vectors and host cells control (promoter) region (ADM76037); recombinant vectors and host cells comprising the NEPHA promoter compounds which inhibit or activate transcription of the NEPHA gene; and pharmaceutical compositions comprising an activator. The antisense oligonucleotide or a transcriptional inhibitor or activator. The antisense oligonucleotides and modulators of NEPHA transcription are useful for inducing apoptosis for the treatment and/or prevention of cancers in which NEPHA is overexpressed such as lung cancer, ovarian cancer, breast cancer, cavical cancer. Second transcription in terpresent transcription factor binding sites within the transcriptional

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel nucleotide carrier with probes used for diagnosis of oral diseases, particularly paradontitis, but also caries, especially to identify genetic predisposition (as indicated by polymorphisms) to disease and to identify causative microorganisms or their associated virulence factors and antibiotic resistance genes, e.g. for selection of therapy and for prognosis. They are also useful for research into oral infections. The carriers allow simultaneous detection of both host and pathogen parameters, providing quickly and simply an individual's paradontitis profile, including detection of pathogens that are associated with increased risk of coronary heart diseases and/or approach on the supportunistic pathogens.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Oligonucleotide array, useful for diagnosing oral diseases, particularly paradontitis, carries human or microbial reference sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ABX03870-ABX04044 represent DNA fragments used to illustrate the method

                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                  The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (WEGF). A patient (preferably human) having a condition associated with the level of the fims-like tyrosine kinase 1 (fl.1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, coular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis,
                                                                                                    Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vascular endothelial growth factor receptor; VBGF receptor; flt-1; flk-1;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour angiogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;

Vascular endothelial growth factor receptor; VEGF receptor; flt-1; flk-1; KDR; hammerhead ribozyme; hairpin ribozyme; cleavage; tumour anglogenesis; psoriasis; rheumatoid arthritis; ocular disease; fms-like tyrosine kinase 1; kinase insert domain containing receptor;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (f1c-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (f1k-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and Theumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression of nucleic acid molecules from the present invention
             vector to the patient. ÄAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention
                                                                                                                                     Gaps
treated by administering the nucleic acid molecule or the expression
                                                                                                                                     0;
                                                                                                                                                                                                                                                                                                                                                                             Mouse flt-1 VEGF receptor hammerhead ribozyme substrate #455.
                                                                                              0.8%; Score 14; DB 1; Length 17; 71.4%; Pred. No. 8.3e+02; cive 4; Mismatches 0; Indels

The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV9721 to AAV98043 and AAV98979 to AAV99000 represent specifically claimed target sequence from human EGF-R. AAV98044 to AAV98066 and AAV98867 to V9878 represent hammerhead ribozymes and hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit cell proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         cerebroprotective, noctropic, neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; intozyme; intozyme; intozyme; intozyme; intozyme; intozyme; le-cil lymphoma; non-Hodgkin's lymphoma; MHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA, Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    which specifically cleave RNA derived from an epidermal growth factor which specifically cleave RNA derived from an epidermal growth factor receptor (EGF-R) gene. AAV97221 to AAV98043 and AAV98979 to AAV99090 receptor (EGF-R) gene. AAV97221 to AAV98046 from human EGF-R. AAV98044 to AAV98066 and AAV98086 frow persone from human EGF-R. AAV98044 hairpin ribozymes respectively for human EGF-R. The NAMs are useful for cleaving EGF-R RNA in the treatment of a condition associated with EGFR expression levels e.g. to inhibit call proliferation in the prevention or treatment of cancers. The NAMs can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of EGF-R RNA in a cell
                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic nucleic acids - which cleave RNA derived from an epidermal growth factor receptor, useful for inhibiting cell proliferation and for treating cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes enzymatic nucleic acid molecules (NAMs) which specifically cleave RNA derived from a figure and acid.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule of possessing an NCH motif), a C-cleaver (Cleaving RNA with a NYM motif) provided the argument RNA with an NGN triplet), a zinzyme (cleaving RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup> +. CC FUTCO. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more cof CD20. The treatment may further comprise the use of one or more streat lymphoma (ML), bulky low-grade or follicular NHL, lymphoma, leukaemia, HIV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC) small B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHL, mantle-cell curgence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, the creatment may further comprise the use of one or more cell and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be contacted with a cell to reduce NOGO activity of the central nervous system (CNG) injury and cerebrovascular accident cell and treat a patient having a condition associated with the level of therapies. In particular, the NOGO-targetting nucleic acid may be used to therapies. In particular, and injury and cerebrovascular accident central nervous system (CNG) injury and cerebrovascular accident central network a dissase, dementia, multiple sclerosis (MS), chemot
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
Parkinson's digease; ataxia; Huntington's disease;
Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Parkinson's disease, ataxia, Huntington b anserve, edisease disease, muscular dystrophy, and/or other neurodegenerative disease

The invention of a CD20 gene and a mucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOCO). The nucleic acids may be enzymatic nucleic acid molecule which down nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NNN motif) proceed an amberzyme (cleaving RNA with an NGN triplei), a zinzyme (cleaving RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a VGY motif). The CD20-targetting nucleic acid is used to cleave RNA cf CD20 in the presence of a divalent cation that is preferably Mg^2 2...

Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level cf CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic leukaemia, HIV fhuman immunodeficiency virus) associated NHL, mantle-cell CH lymphoma (MCL), immunocytoma (IMC) small B-cell lymphoma, immunocytoma (IMC) small B-cell lymphoma, thrombocytopaenia, and inflammatory arthropathy. The NOGO gene in the targetting nucleic acid is used to cleave RNA of the NOGO gene in the Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and invention relates to a nucleic acid molecule which down regulates Claim 88; Page 97; 200pp; English. central nervous system injury.

Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The regulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAzyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule possessing an NCH motif), a G-Cleaver (Cleaving RNA with a NYM motif) promise the CD20 in the presence of a divalent cation that is preferably Mg<sup>2</sup> +. Curhermore, it may be contacted with a cell to reduce CD20 activity of the real and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, HV (numan immunodeficiency virus) associated WHL, municetting nucleic acid may be used to leukaemia, HV (numan immunodeficiency virus) associated WHL, municetting nucleic acid may be contacted with a cell lymphocytic lymphocytic lymphoma, immunocytopaenia, and inflammatory arthropathy. The NOGO ene in the nucleic acid may be contacted with a cell to reduce NOGO activity of the cell and treat a patient having a condition associated with the level of the reatment may further comprise the use of one or more therapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrookscular acident
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ;

GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of GRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation,
                                                                                                                                                             The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to oligonucleotides that downregulate the expression of human Grb2-related with Insert Domain (GRID) gene. GRID is a T-cell co-stimulatory adaptor protein. The oligonucleotides are useful for modulating the expression of RRID, to treat conditions such as tissue/graft rejection and leukaemia. The oligonucleotides can also be administered in conjunction with other therapies such as radiation, chemotherapy and cyclosporin treatment. The present oligonucleotide was
chemotherapy and cyclosporin treatment. The present oligonucleotide was
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Domain
                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                          Human, Grb2-related with Insert Domain, GRID, T-cell;

This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hPAPP-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. PAPP-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the antibodies can be used to assess the expression levels of PAPP-E isoform proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence reperseents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PAPP-E; human; pregnancy associated plasma protein E; abortive; contraceptive; gene therapy; vaccine; pregnancy; antenatal; diagnosis; dysgenetic pregnancy; primer; ss.

The invention relates to genetically modified fungus with an increased ability to utilise L-arabinose, where the fungus has been transformed with a DNA sequence encoding an L-arabinito1 4-dehydrogenase (EC 1.1. 1.12) or L-xylulose reductase (EC 1.1.1.10) or both the DNA sequences. Genetically modified fungus is useful for producing useful products from biomass containing L-arabinose. The useful product include ethanol, lactic acid or xylitol preferably ethanol. It is also useful to ferment a carbon source such as biomass comprising agricultural or forestry products and waste products containing L-arabinose and also other pentoses or other fermentable sugars. The present sequence is a PCR primer used to clone T. resesi L-arabinitol 4-dehydrogenase gene. (Updated on 29-AUG-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Cytostatic; virucide; neuroprotective; nootropic; neuroleptic; gene chip; antisense; sense; tumour; cell degeneration; cancer; Alzheimer's disease; schizophrenia; protein chip; gene therapy; tumour suppression;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated nucleic acid, useful for treating viral diseases associated with tumors and cell degeneration, also related polypeptides, antibodies and transfected cells.
                                                                                                                              Genetically modified fungus for producing useful products such as ethanol, lactic acid and xylitol, from biomass containing L-arabinose, has increased ability to utilize L-arabinose.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Tumour suppression related human fukutin oligo SEQ ID No 1839.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This invention describes a novel isolated nucleic acid that encodes one of three new isoforms of human pregnancy associated plasma protein E, hpapp-E. The products of the invention have abortive and contraceptive activity and can be used for gene therapy or in a vaccine. The nucleic acid, polypeptide encoded by it, or antibody to the polypeptide can be used in pharmaceutical compositions or vaccines for preventing or aborting pregnancy. Papp-E is used in the antenatal diagnosis of dysgenetic pregnancies. The nucleic acids are used as probes to assess the level of PAPP-E isoform mRNA in chorionic villus samples, and the proteins in chorionic villus samples, to diagnose dysgenetic pregnancies proteins in chorionic villus samples, to diagnose dysgenetic pregnancies antenatally. This sequence represents an oligomer used in scanning the human PAPP-E genes described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Genetically modified fungus; L-arabinose; L-arabinitol 4-dehydrogenase; BC 1.1.1.12; L-xylulose reductase; BC 1.1.1.10; agricultural product; biomass; lactic acid; xylitol; forestry product; fermentable sugar; ethanol; enzyme; PCR; primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         3900 PCR primer, to clone T. reesei L-arabinitol 4-dehydrogenase gene.

The invention tradects to a mover isolated 1, mer incident atto sequence, given in the specification, a sequence containing at least 15 consecutive nucleotides from the 17 mer sequence, a sequence, a sequence, a sequence that considering them t, at least 80 % identify to the 17 mer sequence, a sequence that tybridizes to them under highly stringent conditions, or the complement of any of them, or the corresponding RNA. The novel isolated mucleic caids of the invention are useful as probes and primers for detecting, identifying admitifying and/or amplifying a nucleic acid, e.g. as one component of a gene chip, in vitro as (anti) sense reagents, and for production of recombinant polypeptides. Any of the nucleic acids, containing the nucleic acids, cells containing the cortor or antibodies directed against the polypeptides are useful for preparation of pharmaceuticals for prevention and/or treatment of viral degeneration, specifically cancer but also Alzheimer's disease and containing the expression of the 17 mer nucleic acids in diseases. The polypeptides can also be used to generate antibodies, and contained samples is useful for disgnosis and/or prognosis of these contained contains the polypeptides and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene there are therefore and antibodies are useful as components of protein chips. The nucleic acid sequences of the invention can be used in gene therapy. This polypucteetide sequence represents a tumour suppression contains and protein contains and antibodies are useful and antibodies. The invention relates to a novel isolated 17 mer nucleic acid sequence, \$

Novel enzymatic nucleic acid molecules which down regulates expression of a sequence encoding a subunit of nuclear factor kappa B useful for treating cancer, inflammatory disorders and autoimmune diseases.

Claim 3; Page 29; 72pp; English.

The invention describes an enzymatic nucleic acid molecule (I) which down regulates expression of a sequence encoding a subunit of nuclear factor Kappa B (NFRB), where (I) is an incayme, zinzyme, G-cleaver or amberzyme configuration. The enzymatic nucleic acid molecule is adapted to treat cancer and is useful for down-regulating REL-A activity in a cell, for treating a patient having a condition associated with the level of REL-A. (I) is useful for cleaving RNA comprising a sequence of REL-A gene, in the presence of a divalent cation, especially MG'2+. The enzymatic and autisense nucleic acid molecules are useful for treating breast, lung, prostate, colorectal, brain, oesophageal, stomach, bladder, pancreatic, cervical, head and neck, ovarian cancer, melanoma, lymphoma, glioma or therapies such as monoclonal antibodies, REL-A-specific inhibitors or hown-therapies such as monoclonal antibodies, REL-A-specific inhibitors or chemotherapy including pacitizate, docetaxel, cigplatin, methotrexate, cyclophosphamide, doxorubin, fluorouracil carboplatin, edatrexate, gemcitabine or radiation therapy. The enzymatic and antisense nucleic acid molecules are also useful for treating inflammatory disease such as rheumatoid arthritis, restenosis, asthma, Crohn's disease, diabetes, rejection, gene therapy applications, ischaemia/reperfusion injury rejection, gene therapy applications, ischaemia/reperfusion injury (central nervous system (NS) and myocardial), glomerulonephritis, sepsis, allergic airway inflammation, inflammatory bowel disease or infection. This sequence represents the substrate of a novel enzymatic nucleic acid molecule

                                                                                                                                             The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HRS2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS. The sequences shown in ABZ59889 - ABZ62216, ABZ6551, ABZ65520 - ABZ65524, ABZ66530 - ABZ6658 represent substrate/target sequences for the human ribozymes of the invention
                                                                                                                                                                                                                                                                                                                                                  ö

                                                                          The invention relates to a novel short interfering RNA (siRNA) nucleic acid molecule or an enzymatic nucleic acid molecule, that modulates expression of a nucleic acid molecule encoding HER2, K-Ras, H-Ras, N-Ras, human immunodeficiency virus (HIV) or a component of HIV. The nucleic acid molecule of the invention has cytostatic, anti-HIV, and anti-rheumatic activity. The nucleic acid molecules are useful for reducing HER2, K-Ras, H-Ras, and HIV activity in a cell. The nucleic acids are also useful for treating breast, ovarian, colorectal, lung, prostate, bladder, or pancreatic cancer, and HIV infection, and AIDS.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes the use of irinotecan (I) or its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a cytochrome p450, subfamily IIIA (nifedipine oxidase), polypeptide 5 (CYP3A5) polynucleotide (II). (I) and (II) have cytostatic activity. The therapeutic applications of (I) is improved, since it is possible to individually treat a subject with an appropriate dosage and/or an appropriate derivative of (I). Therefore, undesirable, harmful or toxic effects are efficiently avoided. Unnecessary and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes a method for the use of irinotecan (I) of its derivative for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistance protein I (MRPI) polymucleotide (II) (I) has cytostatic activity. (I) or its derivative can be used for the preparation of a pharmaceutical composition for treating colorectal, cervical, gastric, ung, ovarian or pancreatic cancer, or malignant glioma in a subject, where the subject is a human (preferably African or Asian) or a mouse. The present sequence represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           irinotecan, colorectal cancer; cervical cancer; gastric cancer;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the novel use of irinotecan to treat a patient suffering from cancer. This involves determining if the patient has one or or more variant alleles of the UGTIAI gene, and if the patient has one or more of such variant alleles, irinotecan is administered in an increased or decreased amount in comparison to the amount that is administered or decreased amount in comparison to the amount that is administered without regard to the patient's alleles in the UGTIAI gene. The invention has cytostatic activity. A composition of the invention acts as a topologomerase I inhibitor. The method is useful for treating a patient, an animal e.g. mouse or a human, preferably African or Asian, suffering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   from cancer such as colorectal, cervical, gastric cancer, lung, ovarian, pancreatic cancer or malignant glioma. The present sequence is udes in

New use of irinotecan for preparation of pharmaceutical compositions for treating cancer in subject having genome with variant allele comprising multidrug resistance 1 polynucleotide.
                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates ro a novel use of irinotecan or its derivative for the preparation of a pharmaceutical composition for treating colorectal,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; ss; GRID; Grb2-related with insert domain; hammerhead ribozyme; NCH ribozyme; G-cleaver ribozyme; Zinzyme; DNAzyme; amberzyme; Inozyme; hairpin ribozyme; tissue rejection; graft rejection; leukaemia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprise multidrug resistance 1 (MDR1) polynucleotide. A composition of the invention has cytostatic activity. The present sequence is used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to the novel use of irinotecan or its derivative for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject having a genome with a variant allele which comprises a multidrug resistence 1 (MDR1) polynuclectide. A composition of the invention has cytostatic activity. The invention is useful for the preparation of pharmaceutical compositions for treating colorectal, cervical, gastric, lung, ovarian or pancreatic cancer, or malignant glioma in a subject (preferably human, more preferably African or Asian) or a mouse. The present sequence is used in the exemplification of the

New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/draft rejection and gene, useful for treating a condition of GRID, e.g. tissue/graft rejection and

Claim 4; SEQ ID NO 73; 74pp; English.

The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRLD) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treathing a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at less the novel nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acids of the invention.

```
The invention relates to a nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, e.g. a harmeribad ribozyme, NGH ribozyme, G-cleaver ribozyme, Zinzyme, DNAzyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, reducing GRID activity in a treating a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or lenkaemia) by contacting the cell with the novel nucleic acid molecule, an expression contacting the cell with the novel nucleic acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule that cleaves RNA derived from a GRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, a traver ranion for the contaction and leukaemia. The present sequence is

    tissue/graft rejection and leukaemia. The present sequence is
region for the enzymatic nucleic acids of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

New nucleic acid molecule that down-regulates expression of Grb2-related with insert domain (GRID) gene, useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and Leukemia.

Claim 4; SEQ ID NO 75; 74pp; English

Sequence 17 BP; 4 A; 5 C; 3 G; 0 T; 5 U; 0 Other;

The invention relates to a nucleic acid molecule that down-regulates expression of GrD2-related with insert domain (GRID) gene, e.g. a hammerhead ribozyme, NCH ribozyme, G-cleaver ribozyme, Zinzyme, DNDxyme, amberzyme, Inozyme or hairpin ribozyme. Also include are a mammalian cell including the novel nucleic acid molecule, reducing GRID activity in a cell by contacting the cell with the novel nucleic acid molecule, treating a patient having a condition associated with the level of GRID (e.g. tissue/graft rejection or leukaemia) by contacting the cell with the novel nucleic acid molecule, cleaving RNA of a GRID gene by contacting the cell with the novel nucleic acid molecule, acid molecule, an expression vector comprising a nucleic acid sequences (encoding at least the novel nucleic acid molecule in a manner that allows its expression), a mammalian cell including the expression vector and an enzymatic nucleic acid molecule that cleaves RNA derived from a CRID gene. The nucleic acid molecule is useful for treating a condition associated with the level of GRID, e.g. tissue/graft rejection and leukaemia. The present sequence is a target region for the enzymatic nucleic acids of the invention.

Nucleic acid molecule modulating VEGF receptor(s) gene expression or mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient.

Claim 4; Page 120; 218pp; English.

The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient

A method has been developed of defining a set of compounds that modulate the expression of a target nucleic acid (tNA) sequence via binding of the compounds with the tNA sequence. The method comprises generating a evaluating in silico the binding of the virtual compounds with the tNA according to defined criteria. Also described are: (1) a method of according to defined criteria. Also described are: (1) a method of a defining a set of oligonucleotides (ONS) that modulate the expression of a tNA sequence via binding of the ONS with the tNA sequence comprising generating a library of virtual compounds in silico according to defined criteria, and evaluating in silico the binding of the virtual ONS with the tNA according to defined criteria; and (2) a method of defining a set of compounds that modulate the expression of a tNA sequence via binding of the compounds with the tNA. The methods can be used for the generation and identification of synthetic compounds having defined physical, ö to рe treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention nsed fms-like tyrosine kinase I (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can Brooks DG; Human ELK-1 phosphorothioate antisense oligonucleotide SEQ ID NO:206.                                                                                                                                                                                                                                                                                                                                                                                                                                        g
```

Sequences AAZ06571-Z06607 are antisense polynucleotides targeted to a nucleic acid molecule encoding human ELK-1 (also known as p62TCF). ELK-1 is a member of the ternary complex factor subfamily of Ets-domain transcription factor proteins. The polynucleotides inhibit the expression of human ELK-1, and this sequence targets the 5' untranslated region of the ELK-1 RNA. Sequences AAZ06571-Z06607 all cause at least 30% inhibition of ELK-1 expression. The antisense sequences can be used to

```
0
inhibit the expression of human ELK-1 in human cells or tissues in vitro. BLK-1 uses a bipartite recognition mechanism mediated by both protein-DNA and protein-protein interactions to regulate genes by direct and indirect DNA binding and has been shown to control various signal transduction pathways and other cell functions including apoptosis. This means that antisense compounds inhibiting expression of ELK-1 can be used to treat diseases associated with its expression in animals, particularly humans and to prevent or delay infection, inflammation or tumour formation. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (DNA) oligomes and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used: (i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc.,

This invention describes a novel method for detecting cytosine

methylation in DNA samples by: (i) chemically treating a genomic sample

to convert all non-methylated cytosines to uracil while leaving

methylated cytosines unchanged; (ii) amplification with 2 primer

oligonucleotides and a polymerase; and (iii) analysis of the amplicon and

determing the methylation status of test DNA. The method is used for

deducing the methylation status at different CpG positions, which is

cused for diagnosis and/or prognosis of a very wide range of disorders,

cused for diagnosis and/or prognosis of a very wide range of disorders,

cused for diagnosis and/or infocutions, inflammation, etc. The method is

cused for diagnosis and infections, inflammation, etc. The method is

also useful for differentiating between cell and tissue types and for

investigating cell differentiation. The methylated positions, and

cunvertiative indication of the different methylated positions, and

covery accurate classification; and (ii) eliminates interference from

the ackground DNA, making it suitable for analysis of serum or body fluids

covery accurate classification; and (ii) eliminates interference from

which contain background DNA in large excess). This sequence represents

ca PCR primer used to amplify the human ELK-I gene, described in the
                                                                                                                                                                                                                                         ·

particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously. This sequence represents a PCR primer used in the amplification of the human ELK-1 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, cytosine methylation, methylation status; CpG; infection; cancer; diagnosis; side-effect, cardiovascular disease; gastrointestinal disease; inflammation; cell differentiation; ELK-1; PCR; primer; ss.

differentiating between lung cell proliferative disorders associated with at least one gene and/or their regulatory regions. Specifically, it refers to a method comprising contacting a target nucleic acid in a biological sample with at least one reagent, wherein the reagent is able to distinguish between methylated and non-methylated cpd dinucleotides present in the target DNA. As such, it is possible to further differentiate and diagnose medical conditions including adenocarcinoma and squamous cell carcinoma, and their respective adjacent lung tissue. The present invention describes cytostatic oligomers and RNA-oligomers that are useful as probes for determining the cytosine methylation state or single nucleotide polymorphisms (SNPS) of the target sequence. This cyclic positions within genomic DNA, used in an exemplification of the

New polynucleotides encoding secreted human proteins, derived from human fetal brain, adult skin, adult brain, adult heart, adult thymus and adult aorta cDNA libraries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         This invention describes novel human secreted proteins which are encoded by polynucleotides obtained from fetal brain, adult skin, adult brain, adult heart, adult thymus and adult neart constitutions. The polynucleotides and proteins are predicted to have biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, cytokine and cell proliferation/differentiation activity, immune stimulating (e.g. as vaccines) or suppressing activity, hematopoiesis regulating activity, chemotractic/chemokineic activity, hemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumor activity, anti-inflammatory activity, cadherin/tumor activity, anti-inflammatory activity, the

The present invention relates to a hairpin or hammerhead ribozyme, designed to cleave RNA encoding a cyclin or cell-cycle dependent kinase other than cell-cycle dependent kinases CDKI, PCNA and Cyclin BI.
Representative examples of ribozyme recognition sites are given in AAA8415 to AAA86787. The ribozyme of the invention is useful for inhibiting restenosis by introduction of the ribozyme into cells. The ribozyme is resistant to endonuclease activity and hence is efficient in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; ribozyme therapy, hairpin ribozyme; hammerhead ribozyme; recognition site; target; ribozyme binding site; eye disease; vulnerary; proliferative disease; skin disease; psoriasis; diabetic retinopathy; cytokine; inflammation; cell-cycle dependent kinase; cyclin; MVP; matrix metalloproteinase; growth factor; reductase; scarring; cytostatic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     d
                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes a method for treating a proliferative skin or eye disease and scarring. The method involves administering a cribozyme (I) which cleaves RNA encoding a cytokine involved in inflammation, matrix metalloproteinase (MMP), cyclin, cell-cycle dependent kinase, growth factor or a reductase, or administering a nucleic acid molecule (II) comprising a promoter operably linked to a nucleic acid molecule (II) comprising a promoter operably linked to a characological, cytostatic, antiseborrheic, antidiabetic, antisickling, dermatological, vulnerary, keratolytic and virucide activities, and cleaves RNA encoding cycokine involved in inflammation. (I) can be used in gene therapy. (I) and (II) are useful for treating proliferative skin diseases such as psoriasis, atopic dermatitis, actinic keratosis, squamous or basal cell carcinoma and viral or seborrheic wart. They can also be used for treating proliferative eye diseases such as diabetic retinopathy, vitreoretinopathy, sickle cell retinopathy, retinopathy of carring and preventing and preventing and preventing carring and preventing methods.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                           Treating proliferative skin or eye diseases and scarring, using ribozymes that cleave RNA encoding cytokines involved in inflammation, matrix metalloproteinases, growth factors and cell-cycle dependent kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           or hypertrophic burn

The sinA are useful for modulating downregulating the expression of VEGFF genes. The sinA are potentially useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, neovascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The sinA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-nucleotide polymorphisms). The present sequence is used in the
cytostatic; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; nephrotropic; gynaecological; angiogenesis-associated condition; cancer; diabetic retinopathy; macular degeneration; neovascular glaucoma; arthritis; psoriasis; endometriosis; angiofibroma; polycystic kidney disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes a double-stranded short interfering nucleic acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGRR) gene. Also described: (1) a siNA that downregulates the VEGF gene; (2) kits for in vitro or in vitro delivery of siNA; (3) conjugates and/or complexes of siNA; (4) vectors that express siNA; and (5) single-stranded siNA with similar properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           double-stranded interfering nucleic acid, useful e.g. for treatment diagnosis of cancer, downregulates the vascular endothelial growth
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ..

```
The present invention relates to a method for judging the genotype of hepatitis B viruses (HBV) in which part of the gene sequence of the PreS1 region of HBV is amplified by PCR using labelled primers and the amplified product is hybridized with HBV type A, B, C, D, E, F and G gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Classification of genotype of hepatitis B viruses and primers and probes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Clostridium histolyticum; collagenase; enzymatically active; cleavage; fusion protein; PCR primer; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          specific probes and the label in the PCR product is detected
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         0.8%; Score 14; DB 1; Length 19;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present introduction describes a quodice state interface in the present interface acid (siNA) that downregulates expression of the vascular endothelial growth factor receptor (VEGFR) gene. Also described: (1) a candothelial growth factor receptor (VEGFR) gene. Also described: (1) a candother that downregulates the VEGF gene; (2) kits for in vitro or in vivo delivery of siNA; and (5) single-stranded siNA with similar properties. The siNAs have antianglogenic, cytostatic, nephrotropic and gynaecological activities. The siNA are useful for modulating conditions, useful for treating a wide range of angiogenesis-associated conditions, particularly cancers, diabetic retinopathy, macular degeneration, necvascular glaucoma, arthritis, psoriasis, endometriosis, angiofibroma, and polycystic kidney disease. The siNA may also be useful for diagnosis, drug screening, target identification and validation, genetic engineering, studying gene function, and also for gene mapping (e.g. of single-interior or in the condition).

The present invention describes an enzymatically active polypeptide (I) derived from a Clostridium histolyticum collagenase with its collagencombining region deleted which specifically recognizes a peptide with the sequence PLGP, and which cleaves the peptide by hydrolysing the peptide bond on C-terminal side of the leucine residue of this sequence and which does not decompose water-insoluble type I collagen. The present sequence represents a PCR primer used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Genotyping an alpha-2B, 2A, or 2C adrenergic receptor gene useful for determining whether an individual is at increased risk of developing a disease associated with the corresponding receptor comprises detecting
                                                                                                                                                 New enzymatically active polypeptide and kit containing it - useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; genotyping; alpha-2B; alpha-2A; alpha-2C; adrenergic receptor; polymorphic site; allelic variant; cardiovascular disease; central nervous system disease; adenylyl cyclase; MAP kinase activity; phosphorylation; inositol phosphate; alpha-2BAR; PCR primer; ss.

The coding sequence was isolated from a human kidney cDNA library, but is expressed in most human tissue. The sequences provided by the invention can be used in the diagnosis and treatment of cancer and neurological disorders, and in drug screening to identify compounds capable of the same
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid or its fragments, useful for diagnosing and treating cancer and neurological disorders, corresponds to a catenin-binding protein in signal transduction and gene regulatory pathways.
